

Jeppesen Ops Control

Supports fast and cost-efficient decisions on the day of operations.

Ops Control is a complete aircraft movement management system, allowing operations center managers to proactively manage the flight schedule and aircraft assignments on the day of operation. It is fully integrated with Crew Tracking, providing users with the full view - in one system.

Ops Control is a powerful day of operations tool, providing users with the full view.

Management by exception

Your operation moves and changes quickly. When a change happens, you need to quickly pivot and react in order to keep operations running smoothly. To help you focus on the most critical issues, we offer management by exception through our alert monitor. As soon as there is an issue you need to address, an alert will warn you. If there are no alerts, you can feel confident your operation is running smoothly.

Manage disruptions

Quickly recover from major and minor disruptions by using the recovery optimizer, included in Ops Control, which rapidly provides you with a variety of high-quality recovery options for any kind of disruption, such as an AOG (aircraft on the ground) or a weather event. The system will allow you to retain maximum service levels by recovering from disruptions as quickly as possible, with minimum impact to your operations.

Your airline, your rules

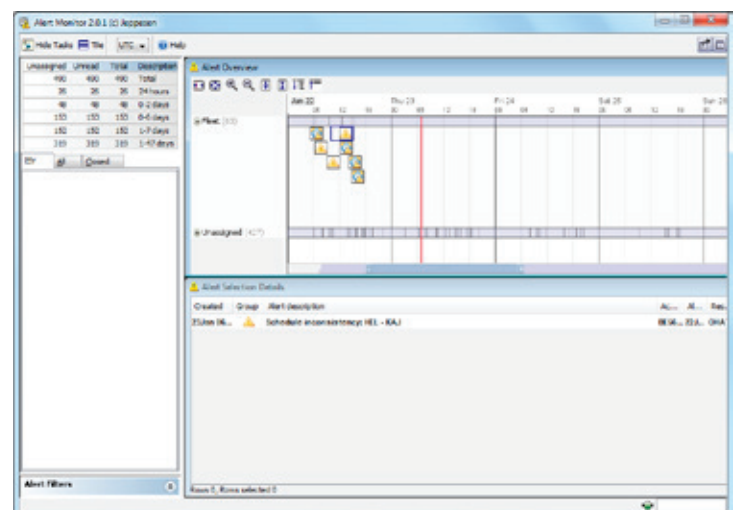

No two airlines are exactly the same. With Ops Control, you can configure our system with your business rules and KPIs. Easily visualize operational costs and how they differ with every change.

See what we can do for your operation

- ✔ Detect critical problems early through alerting.
- ✔ Quickly review multiple recovery options with cost analysis.
- ✔ Management by exception and automation enable users to focus on the day's most important issues.
- ✔ Spend less time managing routine tasks.

Key product features

- ✔ **Schedule manager:** Easily make changes to the schedule on the day of operations.
- ✔ **Alert monitor:** See down-line impacts and address a disruption before it happens.
- ✔ **Aircraft recover solver:** Simulate and choose the best option.
- ✔ **Custom prioritization:** Prioritize based on your business rules, customizable user interface and reports.

An alert monitor makes it fast and easy for users to spot problematic flights.
