

Jeppesen Aviator Briefing

Aviator Briefing, a module available as part of Jeppesen Aviator, helps airlines reduce flight plan production, distribution and storage costs through a complete digitization of the flight briefing process. It contributes to a better flight briefing quality and timeliness, reduces the likelihood of data errors and facilitates an improved post-flight processing and analysis.

Customizable content

- Configures content to meet your operational needs, expediting pilot adoption of electronic flight data

Reduces costs

- Eliminates printing and production costs such as paper, toner and other associated expenses
- Distributing and storing printed documents is no longer needed
- Reduces labor expenses by eliminating the need for handling agents to personally deliver flight briefings, and for personnel to perform manual post-flight data entry

Streamlines processes

- Digitally transfers flight briefings in real-time, reaching any connected pilot immediately, anywhere in the world

Increases flight briefing quality

- The most recent flight briefing information can be digitally transferred closer to the time of departure
- Ensures pilots have the right information at the right time

Improves post-flight analysis

- Grants dispatch immediate access to all post-flight information in digital form
- Eliminates data errors previously caused by manual post-flight data entry processes

Journey Log

Aviator's Journey Log, a feature within the Aviator Briefing module, enables airlines to capture a wide range of information about the flight from pilots. Airlines can tailor the Journey Log to their operational requirements using custom fields, ensuring all required information about the flight is saved for post-flight analysis.

Benefits

- ✔ Provides flexibility for unique airline requirements through configurable custom fields
- ✔ Improves post-flight analysis by supporting the attachment of photos and files
- ✔ Assures compliance with airline data requirements by enforcing mandatory completion of journey log fields prior to flight closure
- ✔ Supports advanced analytics through storage of journey log data in XML format
