Jeppesen FliteDeck Pro

Briefing Module

The Briefing Module for Jeppesen FliteDeck Pro allows pilots to interact with a digital version of their operational flight plan within existing navigational workflows. By enabling this data, pilots can view all relevant flight release information without having the need to switch applications or lose their situational awareness.

Key Benefits:

- Reduce flight plan production, distribution and storage costs by completely digitizing the flight briefing process
- Lower EFB management costs and improve flight deck workflows by reducing the number of applications managed on your pilots' devices
- Increase flight briefing quality by digitally transferring the most recent flight briefing information closer to flight departure ensuring pilots have the best and most current information for their flight
- Improve post-flight analyses by giving dispatchers and back-office immediate access to digital flight data

Key Capabilities:

- Seamless integration with the world's most reliable mobile airline charting application allows pilots to use existing navigational workflows that improve situational awareness, reduce app switching and keep relevant flight details and ownship position in focus
- Access to electronic flight briefing in ARINC 633 electronic format, including flight summary, time summary, fuel & weights, alternate airport information, dispatched weather, NOTAMs and attachments
- Device-to-device synchronization possible in times of poor or missing internet connectivity

- Digitally sign the flight, loadsheet and NOTOC
- Real-time communication of critical data between pilots and ground operations (e.g. download, signatures, estimates, closure)
- Record aircraft takeoff and landing information and actuals throughout the flight
- Navlog enables pilots to view time and fuel trends at a glance along with meteorological and waypoint information needed to make informed decisions and take appropriate action in every condition
- Record actual time and fuel values for waypoints using the navigation map
- Capture ATIS, ATC clearance, RVSM check, fuel check and pilot remark information
- View live weather layers overlaid on Jeppesen navigational data along with the route of flight as well as live textual weather
- Grant dispatch immediate access to all post-flight information in digital form, while eliminating data errors previously caused by manual post-flight data entry processes

Keep your operations efficient and your fleet mobile

Minimize operational interruptions with backup redundancies like Jeppesen's cloud-based network, device-to-device sync, and web-based "Trip Kit", which gives you a safety net for getting navigational information to pilots in the event of network, hardware or connectivity issues.

World-Class Support

FliteDeck Pro Briefing is backed by more than 80 years of Jeppesen trust and reliability. We'll be with you every step of the way, 24/7, to assist your operation with guidance and support, wherever and whenever needed.
